SOLUTION BRIEF
Acumatica for contractors

Construction cost and quantity reporting

3
core components live

3
optional additions

Live
in production today

THE CHALLENGE

Project managers often find out their real unit costs weeks after a job has moved past the point where anything could change. They pull budget, actual and projected numbers from separate places just to answer one question: **are we on track, by task and by cost code?**

CORE COMPONENTS

Project cost and quantity report	Budget quantities and costs, period and job to date actuals, projected costs at completion and completion percentages, by task and cost code
Reporting quantity flags	Marks which budget rows count in cost and revenue quantity reporting
Account categories	Adds a category field to the chart of accounts for customer specific classification

OPTIONAL ADDITIONS

Equipment and operator references	Adds equipment and operator identifiers to project transactions
Equipment information	Category and rate fields, asset links, assignment, registration data and supporting imports
Holding account cost allocation	Spreads shared costs and quantities across eligible tasks based on remaining budgets, with period filtering and calculation snapshots

STATUS: READY TO DEMO AND PILOT

Already running in production for contractors on Acumatica. For a new customer we handle configuration, documentation and testing, and agree their quantity and revenue budget conventions (or make them configurable).
